

Django Search Cheat Sheet

1. Search Form (HTML)

```
<form method="get" action="{% url 'product_search' %}">
  <input type="text" name="q" placeholder="Search..." value="{{ request.GET.q }}">
  <button type="submit">Search</button>
</form>
```

2. URL Configuration (urls.py)

```
from django.urls import path
from . import views

urlpatterns = [
    path('search/', views.product_search, name='product_search'),
]
```

3. Search View (views.py)

```
from django.shortcuts import render
from .models import Product
from django.db.models import Q

def product_search(request):
    query = request.GET.get('q')
    products = []

    if query:
        products = Product.objects.filter(
            Q(name__icontains=query) | Q(description__icontains=query)
        )

    return render(request, 'shop/product_search.html', {
        'products': products,
        'query': query,
    })
```

4. Search Results Template (product_search.html)

```
{% extends 'base.html' %}

{% block content %}
```

Django Search Cheat Sheet

```
<h2>Search Results for "{{ query }}":</h2>
```

```
<ul>
```

```
    {% for product in products %}
```

```
        <li>{{ product.name }} - {{ product.description }}</li>
```

```
    {% empty %}
```

```
        <li>No products found.</li>
```

```
    {% endfor %}
```

```
</ul>
```

```
{% endblock %}
```

Quick Reminders

method="get" -> Use GET for search (adds query in URL)

action="{% url %}" -> Sends form to the correct view

request.GET.get('q') -> Gets the query string from user

__icontains -> Case-insensitive matching

Q() -> Combine filters (like OR search)

base.html -> Put the search form here to show it on all pages
